A Note: structure and location of covalently bound carbohydrate

G;Function:

A;Description: catalyzes the protecolytic activation of coagulation factor X in the present gulation factor IX in the presence of calcium and tissue factor

A;Pathway: blood coagulation extrinsic pathway

G;Superfamily: coagulation factor X; EGF homology, Gla domain homology; trypsin homology

G;Keywords: beta-hydroxyaspartic acid; blood coagulation; calcium binding; carboxyglutam

F;1-152/Product: coagulation factor VIIa light chain #status experimental <MA1>

F;50-61/Domain: GIA domain homology (fragment) <GIA>

F;91-127/Domain: EGF homology <EG2>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fil53-407/Product: coagulation factor VIIa heavy chain #status experimental <MA2>

Title: Perfect score: Sequence:

Scoring table:

141681 seqs, 52070155 residues BLOSUM62 Gapop 10.0 , Gapext 0.5 Searched: Total number of hits satisfying chosen parameters: 141681

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt_42:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SUBDIVITY: Synthesized as a single chain precursor, which is cleaved into a light chain and a heavy chain held together by a disulfide bond. The enzyme is then activated by thrombin, which cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is strongly promoted by thrombomodulin.

FIRSUE SPECIFICITY: Plasma; synthesized in the liver.

FTM: The vitamin K-dependent, enzymatic carboxylation of some Glu residues allows the modified protein to bind calcium.

MISCELLANBOUS: Calcium also binds, with stronger affinity to another site, beyond the GLA domain. This GLA-independent binding site is necessary for the recognition of the thrombin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   region of mammalian protein C.";
Br. J. Haematol. 86:590-600(1994).
-!- CHUNCTION: Protein C is a vitamin K-dependent serine protease that regulates blood coagulation by inactivating factors Va and VIIIa in the presence of calcium ions and phospholipids.
-!- CATALYTIC ACTIVITY: Degradation of blood coagulation factors Va and VIIIa.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SUBDUIT: Synthesized as a single chain precursor, which is cleaved into a light chain and a heavy chain held together by a disulfide bond. The enzyme is then activated by thrombin, which cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is frongly promited by thrombomodulin.

TISSUE SPECIFICITY: Plasma, synthesized in the liver. FTM: The vitamin K-dependent, enzymatic carboxylation of some Glu residues allows the modified profein to bind calcium.

MISCELLANEOUS: Calcium also binds, with stronger affinity to another site, beyond the GLA domain. This GLA-independent binding site is necessary for the recognition of the thrombin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Shen L., He X., Dahlback B.;
Submitted (FEB-1956) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Protein C is a vitamin K-dependent serine protease that regulates blood coagulation by inactivating factors Wa and VIIIa in the presence of calcium ions and phospholipids.
-!- CATALYTIC ACTIVITY: Degradation of blood coagulation factors Va
                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!-SUBUNIT: Synthesized as a single chain precursor, which is cleaved into a light chain and a heavy chain held together by a disulfide bond. The enzyme is then activated by thrombin, which cleaves a tetradecapeptide from the amino end of the heavy chain; this reaction, which occurs at the surface of endothelial cells, is strongly promoted by thrombomodulin.
-!- FIRSUE SPECIFICITY: Plasma: Synthesized in the liver.
-!- FTM: The vitamin K-dependent, enzymatic carboxylation of some Glu residues allows the modified protein to bind calcium.
-!- MISCELLANBOUS: Calcium also binds, with stronger affinity to another site, beyond the GLA domain. This GLA-independent binding site is necessary for the recognition of the thrombin-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            "Porcine factor V: cDNA cloning, gene mapping, three-dimensional protein modeling of membrane binding sites and comparative anatomy of domains.";
Cell. Mol. Life Sci. 58:148-159(2001).
-!- FUNCTION: Protein C is a vitamin K-dependent serine protease that regulates blood coagulation by inactivating factors Va and VIIIa in the presence of calcium ions and phospholipids.
-!- CATALYTIC ACTIVITY: Degradation of blood coagulation factors Va and VIIIa and VIIIa.
                                                                                                                                                             Gaps

Genet. 23:373-373 (1999).

-!- FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.

-!- CATALYTIC ACTIVITY: Preferential cleavage: Arg-!-Thr and then Arg-!-Ile bonds in prothrombin to form thrombin.

-!- SUBUNIT: The two chains are formed from a single-chain precursor by the excision of two Arg residues and are held together by 1 on more disulfide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     glutamate residues allows the modified protein to bind calcium.
--- PTM: N- and O-Glycosylated.
--- PTM: THE ACTIVATION PEPTIDE IS CLEAVED BY PACTOR IXA (IN THE INTRINSIC PATHWAY).
--- SIMILARITY: Belongs to peptidase family $1.
--- SIMILARITY: Contains 2 EGF-like domains.
                                                                                                                                                                                                                                                                Cargill M., Altshuler D., Ireland J., Sklar P., Ardlie K., Patil N., Shaw N., Lane C.R., Lim E.P., Kalyanaraman N., Nemesh J., Ziaugra L. Friedland L., Rolfe A., Warrington J., Lipshutz R., Daley G.Q.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -1-1 TISSUE SPECIFICITY: Plasma; synthesized in the liver.
-1- PIM: The vitamin K-dependent, enzymatic carboxylation of some glutamate residues allows the modified protein to bind calcium.
                                                 Proc. Natl. Acad. Sci. U.S.A. 95:6630-6635(1998).

Res. 85:803-514 (1997).

- I- FUNCTION: Factor Xa is a vitamin K-dependent glycoprotein that converts prothrombin to thrombin in the presence of factor Va, calcium and phospholipid during blood clotting.

- CATALYTIC ACTIVITY: Preferential cleavage: Arg-|-Thr and then Arg-|-11e bonds in prothrombin to form thrombin.

- SUBUNIT: The two chains are formed from a single-chain precursor more disulfide bonds.

- The FIM: The vitamin K-dependent, enzymatic carboxylation of some continues allows the modified protein to bind calcium (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. RETISTON TO 395.

TISSUB-Liver;

Ruiz S.R., Blajchman M.A., Clarke B.J.;

Converted to factor VIIa by factor XII, factor IXI, or thrombin by minor proteolysis. In the presence of tissue factor X to factor X to factor IXI, or thrombin by minor proteolysis. In the presence of tissue factor X to factor X to factor IXI in the presence of tissue factor X to factor IX to similarity).

Converted to factor VIIa then converts factor X to factor X in the presence of tissue factor X to factor IX to factor IXI in the presence of tissue factor and calcium (By similarity).

Converted to factor IXI in the presence of tissue factor in factor X to factor X in the presence of tissue factor in the presence of tissue factor in factor X in factor X in the presence of tissue factor in factor X in the presence of tissue factor in factor X in the presence of tissue factor in factor X in the presence of tissue factor in factor X in the presence of tissue factor IXI in factor X in the presence of tissue factor in factor X in the presence of tissue factor in the presence of tissue factor IXI in the terodimer of a light chain and a heavy chain linked by IXI is the vitamin K-dependent, enzymatic carboxylation of some of putch and the modified protein to bind calcium (By cimilarity).
                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright.
